

Supplementary Figure 3(A) Relative abundance of gut bacterial taxa over time. Stacked bar plots show the mean relative abundance of the 11 most abundant bacterial genera across experimental groups (Uninfected, ST1.75, ST1.12) at days 1, 2, and 7 post-infection in mice receiving metronidazole/vancomycin (mnvc) antibiotic treatment. Each color represents a distinct taxon as indicated in the legend.(B) Beta diversity of gut microbiome communities. Principal Coordinates Analysis (PCoA) of Bray-Curtis dissimilarity distances for days 1, 2, and 7 post-infection. Each point represents an individual mouse; colors denote experimental group (blue: ST1.75, orange: ST1.12). The percentage of total variance explained by each principal coordinate axis is indicated in parentheses.
